

## The Energetic Responsiveness of Water is Increased by the AquaVita Energizer

Before

After

The following images are Gas Discharge Visualization (GDV) pictures taken of a drop of water before and 1 minute after AquaVita Energizer water was placed into purified water. These images are computer generated representations of biophoton corona discharge patterns produced by high-voltage electrophotography taken with a Gas Discharge Visualization Camera (GDV). GDV is a Russian technology that assesses the subtle energy of a substance or human.

**As seen above, the AquaVita Energizer dramatically increases the energetic responsiveness of the water. The diameter of the corona discharge is much larger in the AquaVita water than the diameter of the purified water without the AquaVita Energizer. Also, the AquaVita water has pronounced flares, originating from a few action sites, indicating a more highly structured water.**
